1. Add Inputs Account no, currency, Office name in it.

The screenshot displays a web application interface with a dark theme. A modal window titled "إضافة بنك" (Add Bank) is open in the center. The modal has a close button (X) in the top right corner. Inside the modal, there is a label "اسم البنك" (Bank Name) followed by a text input field. Below the input field is a red button labeled "حفظ" (Save). The background shows a dashboard with a sidebar containing "Dashboard", "Vouchers", and "Settings". The main content area has a header with "Dashboard", "29 Dec 2024", "Military Attaché", "Islamabad", "دولة قطر" (State of Qatar), and "الملاحقة العسكرية" (Military Attaché). There are also some icons and text in the background, including "البنوك" (Banks) and "الرقم التتبعي" (Tracking Number).

Overall:

1. Tables should be searchable, filterable. Can use some library etc.
2. In all three form When we open any form there should be a table that show previous added vouchers and there should be a create voucher button when click on that then open voucher form. And in table there should be info icon and delete option. When click on info icon it should open form and all the form values should be visible there that were added and user can edit it also if want. When delete it should not be visible in table but don't delete from database.
